INTRODUCTION

This project is developed using Java programming language.

The main purpose of this project is to help users track their daily expenses in an easy way.

In today's life, people spend money on many things but forget where the money goes.

This project helps users record their expenses and understand their spending habits.

PROBLEM STATEMENT

Many students and individuals do not keep a record of their daily expenses. They spend money on food, travel, shopping, etc., but do not track it.

Because of this:

- They lose control over their budget
- They cannot save money properly
- They do not know where most money is spent

So, there is a need for a simple system to track expenses.

OBJECTIVE

The main goal of this project is to make a simple and easy expense tracker.

This system helps users to:

- Add their daily expenses easily
- See all expenses in one place
- Find the total money they have spent

The aim is to make money management easy for beginners.

FEATURES

This project has these simple features:

- **Add Expense**: User can enter expense details like amount and description
-
- **View Expenses:** User can see all the expenses they added
-
- **Total Expense:** The program shows the total money spent
-
- **Simple Interface:** Easy to use with basic input and output for beginners

TECHNOLGY USED

The project is developed using the following technologies:

- **Java Programming Language:** Used to write the main logic of the program
- **Array List:** Used to store multiple expense records dynamically
- **Scanner Class:** Used to take input from the user through keyboard

These technologies make the program simple and efficient.

KEY DECISIONS

While making this project, I made some simple decisions:

- I used Array List to store expenses because it can grow when needed.
- I kept the program simple (console-based) so it is easy to use and build.
- I focused on making the program easy to understand for beginners.

CHALLENGES FACED

During the project, I faced some difficulties:

- Handling user input correctly using Scanner
- Storing and displaying multiple expenses properly
- Calculating total expense without errors
- Understanding how Array List works

But I solved these problems by practicing and debugging the code.

WHAT I LEARNED

From this project, I learned many useful things:

- How to use Java for real-life problems
- How to take input and display output
- How to use Array List for storing data
- Basic problem-solving and logic building
- Importance of tracking expenses in daily life

CONCLUSION

This project is useful for managing daily expenses in a simple way.

It helps users understand their spending and control their budget.

The project is easy to use and can be used by students and beginners.

It also improves programming skills in Java.
